Understanding Be The Match and Its Purpose

Be The Match is a national bone marrow registry operated by the National Marrow Donor Program. It plays a vital role in matching stem cell and bone marrow donors with patients suffering from blood cancers, genetic disorders, and other life-threatening diseases. The registry maintains a database of potential donors who have submitted their tissue type information, enabling rapid identification of compatible donors worldwide. The Be The Match swab guide focuses on the initial step for donor registration: the collection of a cheek swab sample for human leukocyte antigen (HLA) typing. This typing identifies unique markers essential for matching donors and recipients accurately.

The Swab Collection Process

What Is a Be The Match Swab?

The Be The Match swab is a painless and straightforward method to collect cells from the inside of the cheek using a sterile cotton swab. This sample provides enough DNA to perform HLA typing, which is crucial for determining compatibility between donors and patients. Because it is non-invasive, the swab is preferred over blood draws for initial donor registration.

Step-by-Step Swab Collection Procedure

The swab collection process involves a few simple steps, typically performed by the donor or a trained professional. These steps ensure the sample quality is sufficient for accurate testing:

1. Wash hands thoroughly before handling the swab.
2. Open the sterile swab package without touching the swab tip.
3. Rub the swab firmly against the inside of the cheek for about 30 seconds, rotating it to collect ample cells.
4. Repeat the swabbing on the other cheek with a new swab if required.
5. Allow the swab to air dry for a few minutes before placing it into the provided sterile container.
6. Seal the container and complete any necessary documentation.
7. Return the sample to the collection site or mail it according to instructions.

Following these steps carefully ensures the sample integrity and helps avoid delays in processing.

Eligibility and Preparation for Swab Testing

Who Can Join Be The Match Registry?

Eligibility criteria for joining the Be The Match registry via the swab method typically include age, health status, and residency requirements. Potential donors generally must be between 18 and 60 years old, in good health, and willing to commit to donation if matched. Certain medical conditions or medications might exclude an individual from registration due to donor safety concerns or transplant compatibility.

Preparing for the Swab Collection

Proper preparation helps improve the quality of the swab sample. Donors should avoid eating, drinking, smoking, or chewing gum for at least 30 minutes before swabbing to prevent contamination. Washing hands before handling the swab is essential to maintain sterility. Additionally, it is advisable to follow any specific instructions provided by the collection kit or coordinator to ensure optimal sample quality.

After the Swab: What Happens Next

Sample Processing and HLA Typing

Once the swab sample is received by the Be The Match laboratory, DNA is extracted and analyzed to identify the donor's HLA markers. This data is entered into the registry database and made available for matching with patients in need of transplants. The typing process is thorough and typically takes several weeks.

Notification and Further Steps

If a donor's tissue type matches a patient, Be The Match will contact the donor for further testing and evaluation to confirm compatibility and assess overall health. Donors who proceed may be asked to undergo additional procedures, but the initial swab is the critical first step in the donor journey.

Maintaining Contact Information

Donors are encouraged to keep their contact information current with Be The Match to receive timely notifications if matched. Regular communication ensures donors can be reached promptly in urgent situations requiring stem cell or bone marrow donation.

Frequently Asked Questions About Be The Match Swab

Is the Swab Process Painful?

The swab procedure is completely painless and non-invasive. It involves simply rubbing a cotton swab inside the cheek, which might cause minor discomfort for a few seconds but no pain.

How Long Does It Take to Get Results?

After mailing the swab, it generally takes several weeks for the laboratory to process the sample and enter the HLA typing into the registry. Donors will not be notified unless they are a potential match for a patient.

Can Anyone Donate After Registering?

Not all registered donors will be called upon to donate. Many people remain on the registry without ever being selected. Eligibility for donation depends on matching criteria and health evaluations at the time of potential donation.

What Are the Benefits of Joining Through the Swab?

Joining Be The Match via the swab method is convenient, quick, and non-invasive. It allows individuals to contribute to saving lives without the need for blood draws or clinic visits during initial registration.

- Simple and painless collection
- Enables rapid HLA typing
- Supports a vital national registry
- Increases chances of finding life-saving matches

Frequently Asked Questions

What is the 'Be The Match' swab kit and how does it work?

The 'Be The Match' swab kit is a tool used to collect cheek cell samples to determine if someone is a potential bone marrow donor. The kit includes a swab that you use to gently scrape the inside of your cheek, which is then sent to a lab for analysis and added to the national donor registry.

How do I properly use the 'Be The Match' swab kit to ensure an accurate sample?

To properly use the 'Be The Match' swab kit, avoid eating, drinking, or smoking for at least 30 minutes before swabbing. Rub the swab firmly along the inside of your cheek for about 30 seconds on each side. Allow the swab to air dry before placing it in the provided container to avoid contamination.

Can minors use the 'Be The Match' swab kit to register as donors?

Yes, minors can use the 'Be The Match' swab kit to register, but age requirements vary by region. Typically, individuals aged 18 or older can join the registry. Some programs may allow 17-year-olds to join with parental consent. It is important to check the specific guidelines in your area.

What happens after I send my swab kit back to 'Be The Match'?

After you send your swab kit back, the sample is processed and your tissue type is added to the national marrow donor registry. If you are a match for a patient in need, 'Be The Match' will contact you for further testing and to discuss the donation process.

Are there any risks or side effects from using the 'Be

The Match' swab kit?

Using the 'Be The Match' swab kit is non-invasive and safe. The only potential minor discomfort is a brief tickling or slight irritation inside the cheek during the swabbing process. There are no significant risks or side effects associated with collecting the sample.

This first edition, published in February 2025, is the collective work of eight distinguished medical professionals, combining their expertise in microbiology, infectious diseases, and clinical medicine. The book takes a dual approach — offering evidence-based clinical guidelines for healthcare providers while presenting clear, accessible information for patients. It covers a wide range of STIs caused by bacterial, viral, fungal, and protozoal pathogens, including gonorrhea, chlamydial infections, syphilis, herpes simplex virus, human papillomavirus (HPV), and vaginal candidiasis. Key features of the book include: • Diagnostic Protocols: Detailed procedures for laboratory testing — from specimen collection and microscopy to advanced nucleic acid amplification tests (NAAT) — ensuring accurate identification of STI pathogens. • Clinical Management: Comprehensive

algorithms for syndromic and etiological management of common STI presentations, such as vaginal discharge, urethral discharge, and genital ulcers. • Public Health Focus: Insights into the epidemiology of STIs, the intersection with HIV/AIDS, and strategies for prevention and control at both individual and community levels. • Patient Education: A dedicated section that explains STI symptoms, treatment options, and preventive measures, fostering awareness and reducing stigma. • Quality Control in Labs: Guidelines on biosafety, quality assurance, and maintaining high standards in diagnostic laboratories. This handbook is a valuable resource for clinicians, microbiologists, medical students, and public health professionals. It also serves as a reliable guide for patients seeking to better understand STIs and how to manage them effectively. Through this collaborative effort, the authors aim to enhance diagnostic accuracy, streamline treatment protocols, and strengthen public health strategies — ultimately contributing to better sexual and reproductive health outcomes.
