fruit of the earth research: Transpersonal Research Methods for the Social Sciences William Braud, Rosemarie Anderson, 1998-04-29 There is no shortage of research methods that are easily applied to the study of everyday human experience. How, though, does one attempt to study extraordinary human experiences - ultimate values and meanings, peak experiences, transcendence and heightened awareness, among others. William Braud and Rosemarie Anderson introduce a series of transpersonal research methods that are intended to help researchers develop new ways of knowing and methods of inquiry. While these methods will be of particular interest to researchers in transpersonal psychology, humanistic psychology, or transpersonal studies applied to traditional fields, the authors argue that these approaches - with their emphasis on developing intuition, empathy and self-awareness - can benefit anyone involved in the research enterprise across many disciplines.

It can be seen as an overall framework that puts a diversity of green ideas into perspective. Its aims are low work, high output, and genuine sustainability.

fruit of the earth research: Approaching Crisis of Global Cooling and the Limits to Growth

Shigenori Maruyama, 2012-12-20 We are at the terminal point of the warm interglacial period, and the next glacial age may anytime start. The first step of the global cooling is predicted by the author to come in 2035, when the food production will surely decrease. The population is expanding and the shortage of food and drain of natural resources result in the limits to the growth of the human society. It was predicted by the Rome Club (1972) that The Limits to Growth would come in 2020. All these conditions together corroborate to bring a severe crisis to human beings in near future. If the earth would be meeting warming in near future as predicted by IPCC, then the crisis would be mild. However, it is not the case. The atmospheric temperature of the earth will surely become cold, because most of major controlling factors of the atmospheric temperature, i.e., solar activity, cosmic rays, and geomagnetism are changing in a way to the cooling. The effect of carbon dioxide gas only cannot be too much evaluated. The effort of decreasing carbon dioxide gas is important in the sustainability of our limited resources, however, we have to seriously consider the measures for the approaching crisis of global cooling and the limits to growth.

fruit of the earth research: The Pulse of the Earth Adam Bobbette, 2023-06-30

In The Pulse of the Earth Adam Bobbette tells the story of how modern theories of the earth emerged from the slopes of Indonesia's volcanoes. Beginning in the late nineteenth century, scientists became concerned with protecting the colonial plantation economy from the unpredictable bursts and shudders of volcanoes. Bobbette follows Javanese knowledge traditions, colonial geologists, volcanologists, mystics, Theosophists, orientalist, and revolutionaries to show how the earth sciences originate from a fusion of Western and non-Western cosmology, theology, anthropology, and geology. Drawing on archival research, interviews, and fieldwork at Javanese volcanoes and in scientific observatories, he explores how Indonesian Islam shaped the theory of plate tectonics, how Dutch colonial volcanologists learned to see the earth in new ways from Javanese spiritual traditions, and how new scientific technologies radically recast notions of the human body, distance, and the earth. In this way, Bobbette decenters the significance of Western scientists to expand our understanding of the evolution of planetary thought and rethinks the politics of geological knowledge.

fruit of the earth research: New Perspectives on Human Sacrifice and Ritual Body Treatments in Ancient Maya Society Vera Tiesler, Andrea Cucina, 2007-02-15 The central goal of this book is to contribute to the timely discussion and understanding of Maya sacrifice and related posthumous body manipulation. Most school children in the US learn about the Maya and their practices based on their cultural and religious beliefs in their Social Studies classes. But a number of new sites have been discovered, giving an interdisciplinary group of researchers a channel to discuss these acts and their meaning. The editors bring together not only archaeologists but anthropologists, forensic anthropologists, art historians and bioarchaeologists, giving the volume a more complete perspective on these sites and the material culture and biological evidence found there. The field of archaeology is growing to include the physical remains of ritual practice along with the material remains and this book can be seen as an example of how the study of ancient civilizations can be more comprehensive. Additionally, this is an international volume with scholars from the area studied which is becoming more and more important in archaeological research. This will be of interest to students studying Mayan and Mesoamerican culture as well as those interested in bioarchaeology and human sacrifice.

Each was distinguished in his or her own scholarship and made distinctive contributions in specific fields -- as historical, political or population geographers, and, in one case, as a hydrologist-geomorphologist. The subjects also shared a commitment to the educational benefits of geography and of geographical research that was rooted in a vision of geography as socially illuminating and individually life-changing. Here is further rich testimony of the importance of geographers' lives to the lived experience of geography in practice.

fruit of the earth research: International Construction Management Research Igor Martek, 2024-12-30 This book lays out the evolution of the often contested construction management discipline. How is the field defined? What has been discovered to date? Who are the researchers involved? Where is the research being conducted? What national priorities exist among the many nations now grappling with how to absorb foreign construction expertise, or compete in the global commons? Despite the overwhelming economic and political importance of the global construction industry and its impact on the world, until now, there has been no book dedicated to describing the body of research in the field, or where the knowledge frontier lies. This book is the first of its kind, offering a comprehensive appraisal of the state of play in the emerging field of international construction management (ICM) research. It will serve as a reference guide for academics and researchers embarking on or already active in global construction management research. It lays out who the researchers are, along with their fields of expertise, the institutions dedicated to ICM research, global research trends, the journals accepting ICM research, and a country-by-country analysis of national research priorities. It will assist the fledgling PhD and the budding researcher, as well as the discipline expert, in making better decisions on how to advance the field of international construction management through research that both augments CM education and directly benefits the industry.
