Understanding the Impact Factor in Academic Publishing

The impact factor is a widely recognized metric used to evaluate the relative importance of academic

journals within their respective fields. It is calculated annually and reflects the average number of citations received per paper published in the journal during the preceding two years. The impact factor is often utilized as a proxy for the journal's prestige, quality, and influence in disseminating impactful research.

How the Impact Factor Is Calculated

The calculation of the impact factor involves dividing the total number of citations in a given year to articles published in the previous two years by the total number of citable items published during those two years. Citable items typically include articles, reviews, and proceedings papers but exclude editorials or letters.

Limitations and Criticisms of Impact Factor

While the impact factor is widely used, it has limitations. It favors journals publishing review articles, which tend to receive more citations. It may also not reflect the quality of individual articles and can be influenced by citation practices within disciplines. Alternative metrics such as the h-index or Eigenfactor are sometimes used in conjunction to provide a broader assessment of impact.

frontier in cardiovascular medicine impact factor: Cardiovascular Risk Factors Armen Yuri Gasparyan, 2012-03-14 Cardiovascular risk factors contribute to the development of cardiovascular disease from early life. It is thus crucial to implement preventive strategies addressing the burden of cardiovascular disease as early as possible. A multidisciplinary approach to the risk estimation and prevention of vascular events should be adopted at each level of health care, starting from the setting of perinatology. Recent decades have been marked with major advances in this field, with the emergence of a variety of new inflammatory and immune-mediated markers of heightened cardiovascular risk in particular. The current book reflects some of the emerging concepts in cardiovascular pathophysiology and the shifting paradigm of cardiovascular risk estimation. It comprehensively covers primary and secondary preventive measures targeted at different age and gender groups. Attention is paid to inflammatory and metabolic markers of vascular damage and to the assessment of vascular function by noninvasive standardized ultrasound techniques. This is a must-read book for all health professionals and researchers tackling the issue of cardiovascular burden at individual and community level. It can also serve as a didactic source for postgraduate medical students.

frontier in cardiovascular medicine impact factor: *Handbook of cholesterol* Ronald Ross

Watson, Fabien De Meester, 2023-07-31 The handbook of cholesterol - biology, function and role in health and disease - gathers a substantial set of contributions supporting the modern view that dietary and blood cholesterol are safe or even beneficial in a balanced omega-6/3 fatty acids environment, whereas they may turn into unsafe or detrimental to health in a typical omega-6 fatty acid environment. Dietary and blood cholesterol, including LDL-cholesterol, are secondary risk factors which belong to the human omnivorous diet and physiology, which may represent clinical valid surrogates of the outcome, cardiovascular diseases. However, the primary risk factors, the omega-6/3 fatty acids, determine whether human health is in the safe evolutionary zone or not. Omega-6/3 fatty acids are essential to human physiology. They must be present and maintained in physiologically-defined essential amounts and balanced in blood and tissue lipid pools, through the diet. Chronic deviations from omega-6/3 fatty acids make LDL-cholesterol valid indicators of cardiovascular disease. The handbook takes preventive and acute approaches, based on biochemical and clinical evidence, to the management of cholesterol - a per se non-essential nutrient, yet an essential blood and tissue component. The reviews, especially when combined, will help understand the essentiality of dietary and blood cholesterol as (risk) factors in human health.
