im engineering my limit: Calculus with infinitesimals Efraín Soto Apolinar, 2020-06-30 This book covers the most important ideas of calculus and its applications. An emphasis is placed on the use of infinitely small quantities (i.e., infinitesimals), which were used in the creation of this branch of mathematics. The goal of the author is to provide a smoother transition to the understanding of the ideas of infinitesimal quantity, derivative, differential, antiderivative, and the definite integral. In order to give the reader an easier approach to learning and understanding these ideas, the same justifications given by the creators of the calculus are explained in this book. The justification of the formulas to compute derivatives is deduced according to its historical genesis with the use of the idea of infinitesimal as stated by Leibniz. Also, the justification of the formulas for antiderivatives is explained in detail. Some applications of the calculus are also covered, among them, extreme values of functions, related rates, arc length, area of regions in the plane, volume, surface area, mass, the center of mass, the moment of inertia, hydrostatic pressure, work, and several more. Mathematical rigor is not emphasized in this work, but instead, the meaning of the concepts and the understanding of the mathematical procedures in order to prepare the reader to apply the calculus in different contexts, among them: geometry, physics, and engineering problems. To motivate more teachers and students to use this book, the topics covered have been arranged according to most of the traditional calculus courses. However, because the theory of limits and the definitions of the ideas of calculus based on limits, were created many years later by Cauchy and Weierstrass, the limits and some related ideas (like continuity and differentiability) are not detailed covered.

im engineering my limit: Educating Tomorrow's Engineers Great Britain: Parliament: House of Commons: Science and Technology Committee, 2013-02-08 In the UK we teach young people to become computer users and consumers rather than programmers and software engineers.

This is creating a chronic skills gap in ICT. We need around 82,000 engineers and technicians just to deal with retirements up to 2016 and 830,000 SET professionals by 2020. On the plus side, the Government's proposal to include computer science as a fourth science option to count towards the EBac is welcomed. The Committee also welcomes the EBac's focus on attainment of mathematics and science GCSEs but is concerned that subjects such as Design and Technology (D&T) might be marginalised. A Technical Baccalaureate (TechBac) is being designed but if it is to be a success, schools should be incentivised to focus on the TechBac by making it equivalent to the EBac. Reforms to vocational education following the Wolf Review meant that Level 2 of the Engineering Diploma, a qualification highly regarded, would count as equivalent to one GCSE despite requiring curriculum time and effort equivalent to several GCSEs. The Engineering Diploma, however, is currently being redesigned as four separate qualifications. The Committee also expressed concerns over the Department for Education's (DfE) lack of clarity on its research budget, and use of evidence in decision-making. The DfE needs to place greater focus on gathering evidence before changes to qualifications are made, and must leave sufficient time for evidence to be gathered on the effectiveness of policies before introducing further change. The possibility of gathering evidence from randomised controlled trials (RCTs) should be seriously considered
