impact physical therapy norridge: Impact of Home Physical Therapy on Speed of Functional Recovery Following Elective Total Hip Or Knee Replacement Maria Teresa Schumacher, 1989

impact physical therapy norridge: Physical Activity and Rehabilitation in Life-threatening Illness Amy Litterini, Christopher Wilson, 2021-05-04 This book is a comprehensive summary of the recommendations for best practice, and current evidence, for

physical activity and rehabilitation of functional deficits in individuals with end-stage diseases. While advances in technology have afforded us the opportunity to live longer lives, it has also demanded an expansion of focus of medical interventions towards palliative care to enhance the quality of life. Exercise and healthcare professionals must strive to broaden their perspectives to provide for the unique needs of these individuals, and to successfully engage with them, to achieve the most positive outcomes throughout the entire continuum of care. Healthcare providers play a critical role in advocating for care to allow individuals to remain physically active for as long as possible, even in the face of declining health. Finally, due to the increasing and progressively emergent healthcare utilization required by these individuals, a significant cost burden is experienced by healthcare systems, patients, families, and payers. There is evidence of substantial protective effects of physical activity, prevention, safety, and rehabilitative procedures to reduce hospital readmissions, reduce length of stay, and assist in avoiding unwarranted or unnecessary diagnostic tests or procedures. Physical activity has been proven to have a substantial impact and protective effects on virtually all medical conditions. During curative management, but especially during transitional phases to palliative care, other strategies need enhanced consideration to complement the existing plan of care and help to improve patient's quality of life. Ideally, physical medicine would be at the forefront of allowing individuals to live their best life until the very end. Physical Activity and Rehabilitation in Life-threatening Illness is key reading for academics and policy makers in physical activity, international exercise, wellness and rehabilitation, and related disciplines, as well as research-focused clinicians in settings where patients with advanced illness are frequently encountered.

impact physical therapy norridge: Implications of Psychologically Informed Physical Therapy on Patients with Chronic Pain and Psychosocial Factors Caroline Kennedy, Christian Morini, Genna Swanson, 2018 ABSTRACT: Background: Patients with chronic pain often present to physical therapy clinics with psychosocial factors including depression and fear-avoidance which impede their physical performance in daily life. Psychologically informed physical therapy (PIP) aims

to address these psychosocial factors as they pertain to the physical impairments of the patient. The purpose of this review is to assess the effectiveness of PIP on patients with chronic pain and psychosocial risk factors. Method: A literature review was performed from September 2016 to April 2018 using the databases Pubmed, CINAHL, MEDLINE Complete, and PEDro. Inclusion criteria consisted of an adult population, the English language, retrieved from a peer-reviewed journal, chronic pain lasting greater than 12 weeks, psychosocial risk factors, PIP intervention and functional outcome measures of quality of life (QOL) or pain. Exclusion criteria consisted of studies in which the interventions of PIP were administered by untrained physical therapists, or the treatment was applied from someone other than a physical therapist. Results: Final search strings yielded 48 articles for review; 6 articles were selected to aide in the clinical decision, with one case report not used as there was mismatch between case subject and the patient case inspiring this research effort. Therefore, 5 articles were used for final appraisal to help guide the clinical decision process. Discussion/Conclusion: Based on current literature, PIP is an effective approach to intervention for a patient with chronic pain and psychosocial factors as it has been shown to improve selfreported function, QOL and pain level. Techniques such as graded exposure, activity pacing, and cognitive restructuring are useful to use as therapeutic interventions in addressing the psychosocial components of chronic pain.

impact physical therapy norridge: The Impact of Physical Therapy Residency Or Fellowship Education on Clinical Outcomes for Patients with Common Musculoskeletal Impairments Jason R. Rodeghero, 2013 Background and Purpose: There is an increasing focus on physical therapy specialization through postprofessional residency and/or fellowship training. Scant evidence exists that evaluates the influence of postprofessional education on patient outcomes. The purpose of this study was to compare the outcomes of patients with musculoskeletal impairments between physical therapists who have completed a residency or fellowship program and therapists who have not completed either. Methods: A retrospective cohort design was conducted using data from a survey and an existing commercial database. Physical therapists using the database were surveyed to determine what level of education they completed. Musculoskeletal outcome data for 25,843 patients treated by these physical therapists was extracted from the database for the timeframe of June 2012-June 2013. Data were analyzed with ANCOVA to identify differences between groups in the functional status change, number of visits, duration of care, and efficiency. Logistic regression was used to determine the odds of achieving various magnitudes of improvement between groups. Results: Patients treated by physical therapists who completed residency or fellowship training demonstrated significantly greater improvement in their functions fellowship-trained group had significantly fewer visits than the residency trained group but no the group without training. The fellowship trained group and the group without training had significantly shorter episode durations than the residency trained group. Physical therapists who had completed a fellowship program had significantly greater efficiency, defined as change per visit, than the other groups. Patients are 40% more likely to achieve outcomes 4-5 times greater than MCID values when they were treated by a physical therapist with fellowship training. Discussion & Conclusion: The data analyzed in this observational study demonstrate that physical therapists with fellowship training may achieve greater outcomes for patients with musculoskeletal impairments. There may be a benefit from postprofessional fellowship training that positively influences patient outcomes. No definitive conclusions about residency or fellowship training can be made due to the observational nature of this study.
