math placement test for middle school: Schooled and Sorted Thurston Domina, Andrew M. Penner, Emily K. Penner, 2023-06-22 We tend to view education primarily as a way to teach students skills and knowledge that they will draw upon as they move into their adult lives. However, schools do more than educate students—they also place students into categories, such as kindergartner, English language learner, or honor roll student. In *Schooled & Sorted*, Thurston Domina, Andrew M. Penner, and Emily K. Penner, explore processes of educational categorization in order to explain the complex relationship between education and social inequality—and to identify strategies that can help build more just educational systems. Some educational categories have broadly egalitarian consequences. Indeed, Domina, Penner, and Penner argue that when societies enroll young people in school, making them students, they mark them as individuals who are worthy of rights. But other educational categories reinforce powerful social categories—including race, gender, and class—and ultimately reproduce social and economic inequality in society. Elite colleges, tracked high schools, and elementary school gifted programs provide not only different educational experiences, but also create merit and inequality by sorting students into categories that are defined by the students who are excluded. *Schooled & Sorted* highlights that many of the decisions that define educational categories occur in school-based committee meetings and other relatively local settings. The local nature of these decisions provides many opportunities to define educational categories differently, and for school communities to bring about change. *Schooled & Sorted* is an illuminating investigation into the ways sorting within schools translates into inequality in the larger world. While some educational categorization may be unavoidable, the authors suggest ways to build a more equitable system—and thus a more equitable society.

math placement test for middle school: Brookings Papers on Education Policy: 2003 Diane Ravitch, 2010-12-01 In 1983 the seminal report issued by the National Commission on Excellence in Education, *A Nation at Risk*, charged that most American high schoolers were following a general course of instruction, choosing neither the college-preparatory track nor the vocational option. This pattern, the report complained, had fostered low expectations and a curricular hodge-podge of classes that failed to prepare students for college or work. The commission called on states to implement academic requirements for all students, regardless of background, including four years of English and three years each of science, mathematics, and social studies. Students should not be sorted by their presumed future destinations, the commission reasoned, but should be offered an equal opportunity to get a high-quality education to fit them either for postsecondary education or the modern workplace. Two decades after the commission called on states to reform the high school environment and raise graduation requirements, the Brown Center on Education Policy at the Brookings Institution convened a group of prominent scholars to explore the current state of America's high schools, focusing on new research about reforming these institutions that are so important in the lives of the nation's adolescents. The

questions considered reflected the diversity of the participants and covered a variety of areas—historical, international, sociological, and practical. Data gathered by the U.S. Department of Education show students today are taking many more advanced courses in mathematics and the sciences, while at the same time test scores do not reflect the increases in enrollments in academic courses. In addition, large score gaps remain among students from different social groups. Reform of the high schools must take into account the elementary and middle schools that prepare students and the postsecondary institutions to which students aspire. Adolescent culture and students' views about school and academic work play important roles in student achievement, as do the family and contemporary society in shaping of adolescent behavior. No matter their background, all participants agreed that the key to a successful high school rests with the extent to which it recognizes and strengthens its commitment to the intellectual growth of its students.

math placement test for middle school: Inexplicably Me Chelsea Austin Montgomery-Duban Wächter, 2022-05-03 A hilariously moving and inspirational memoir of a girl with two gay dads, navigating her way through life with joy, love, gratitude, and an excellent sense of humor. As the daughter of two gay fathers in the 90s, Chelsea has always had a different outlook than some people. And yet, her message is one of universal importance - love is the most important force in the world. Through her moving and at times hilarious memoir, Chelsea reflects on how we are all much more similar than we are different. Living "two doors down from normal," Chelsea quickly learned that society loves to put people in boxes, but these boxes do not always reflect how we feel about ourselves. Through *Inexplicably Me*, Chelsea works to bring people together in love and acceptance and to illustrate that, while her story may seem worlds away from others, we all strive for happiness and love. From sharing the stage with President Obama when she was only eighteen years old, to her father spending her senior year of college in federal prison camp, to her biological mother dying of cancer when she was only 56, Chelsea explores her painful and joyful experiences with the hope that readers will find inspiration to face their own challenges and embrace their own joys. *Inexplicably Me* is a bridge for those who fear what they don't understand, as well as a possibility for those who have lacked love in their lives to see how they can start to access their self-worth, begin achieving their dreams, and start loving themselves again. Most of all, it is a reminder that everyone will have an opinion about who you are supposed to be, but you, and

only you, get to decide exactly who it is you want to be.

math placement test for middle school: *Using Assessment Data to Guide Math Course Placement of California Middle School Students* Chun-Wei Huang, Jason Snipes, Neal Finkelstein, 2016 Middle school math placement and progression are topics that are part of an active policy and practice discussion in California and elsewhere. Beginning in the 2008/09 school year, California's State Board of Education recommended that students complete algebra I by the end of grade 8. Between 2003 and 2009 the proportion of grade 8 students taking algebra I rose from 32 percent to 54 percent (Williams et al., 2011). This increase resulted in a larger percentage of grade 8 students scoring proficient or advanced (achieving proficiency) on the algebra I California Standards Test (CST; see box 1 for definitions of key terms used in this report) and in a larger number of grade 8 students scoring far below basic or below basic on the test (Williams et al., 2011). Recent studies show that enrolling in algebra I in grade 8 works well for some students but backfires for others. The consequences of misplacement are most pronounced for students with weaknesses in key foundational areas that support algebra readiness, which frequently translates into difficulty reaching proficiency in higher level math in high school (Finkelstein et al., 2012). One study of California students concludes that placing all grade 8 students in algebra I, regardless of their preparation, sets up many students to fail (Williams et al., 2011). Recent longitudinal analysis of California statewide assessment data suggests that students who do not take algebra I in grade 8 but are successful in general math have a better chance of succeeding in algebra I when they wait until grade 9 (Liang, Heckman, & Abedi, 2012). Tables and figures are appended.
