Basic Mathematical Terms

This section introduces fundamental mathematical terms that serve as building blocks for all areas of mathematics. These terms are commonly used in arithmetic and early mathematics education.

Addition

Addition is a basic arithmetic operation representing the process of combining two or more numbers to find their total or sum. It is one of the four elementary operations and is symbolized by the plus sign (+).

Base

The base in mathematics refers to the number system in use, such as base 10 (decimal system), base 2 (binary system), or base 16 (hexadecimal system). It can also refer to the bottom side of a geometric figure like a triangle or rectangle.

Coefficient

A coefficient is a numerical or constant factor that multiplies a variable or term in an algebraic expression. For example, in $5x$, 5 is the coefficient of the variable x .

Denominator

The denominator is the bottom part of a fraction that indicates into how many equal parts the whole is divided. For example, in the fraction $\frac{3}{4}$, 4 is the denominator.

Exponent

An exponent denotes how many times a number or expression (the base) is multiplied by itself. For instance, in 2^3 , the exponent is 3, indicating 2 is used as a factor three times.

Integer

An integer is a whole number that can be positive, negative, or zero, but not a fraction or decimal. Examples include -3, 0, and 7.

Algebraic Terms

Algebra introduces variables and symbols to represent numbers and relationships. This section covers essential algebraic terms crucial for solving equations and understanding functions.

Equation

An equation is a mathematical statement asserting the equality of two expressions, often containing variables. Solving an equation involves finding the values of variables that make the equality true.

Factorization

Factorization is the process of breaking down an expression into a product of simpler expressions or factors. For example, factorizing $x^2 - 9$ results in $(x - 3)(x + 3)$.

Gradient

In algebra, the gradient refers to the slope of a line, representing the rate of change between two variables. It is calculated as the ratio of the vertical change to the horizontal change between two points.

Hyperbola

A hyperbola is a type of conic section formed by the intersection of a plane with both halves of a double cone. It consists of two disconnected curves called branches.

Identity

An identity is an equation that is true for all values of the variables involved. An example is the distributive identity: $a(b + c) = ab + ac$.

Junction

In algebraic contexts, junction may refer to points where graphs or functions meet or

intersect, crucial for solving systems of equations graphically.

Geometry and Measurement Terms

Geometry involves the study of shapes, sizes, and properties of space. This section explains common terms related to geometric figures and measurement.

Angle

An angle is formed by two rays or lines meeting at a common point called the vertex. Angles are measured in degrees or radians and describe the rotation between the rays.

Bisector

A bisector is a line or segment that divides an angle or another segment into two equal parts. For example, an angle bisector splits an angle into two congruent angles.

Circle

A circle is a set of all points in a plane equidistant from a fixed point called the center. The distance from the center to any point on the circle is the radius.

Diameter

The diameter of a circle is a straight line passing through the center and touching two

points on the circumference. It is twice the length of the radius.

Ellipse

An ellipse is a closed curve formed by all points for which the sum of the distances to two fixed points (foci) is constant. It generalizes the shape of a circle.

Formula

A formula is a mathematical expression or equation that calculates a value based on given variables, such as the area of a triangle ($\frac{1}{2} \times \text{base} \times \text{height}$).

Calculus and Analysis Terms

Calculus deals with change and motion through derivatives and integrals. This section defines fundamental terms used in differential and integral calculus.

Derivative

The derivative represents the rate of change of a function with respect to a variable. It measures how a function's output changes as the input changes, often interpreted as the slope of the tangent line.

Exponentiation

Exponentiation is the operation of raising one quantity (the base) to the power of another (the exponent), indicating repeated multiplication.

Function

A function is a relation between a set of inputs and a set of possible outputs where each input is related to exactly one output. Functions are fundamental in describing mathematical models.

Integral

Integration is the process of finding the integral of a function, which represents the accumulation of quantities, such as area under a curve.

Limit

The limit describes the value that a function approaches as the input approaches some point. Limits are foundational in defining derivatives and continuity.

Maximum and Minimum

Maximum and minimum refer to the highest and lowest points on a graph of a function, known as extrema, important for optimization problems.

Average

The average, or mean, is the sum of a set of numerical values divided by the number of values. It represents a measure of central tendency.

Binomial Distribution

The binomial distribution models the number of successes in a fixed number of independent Bernoulli trials, with a constant probability of success.

Correlation

Correlation measures the strength and direction of a linear relationship between two variables, typically ranging from -1 to 1.

Deviation

Deviation refers to the difference between an observed value and a measure of central tendency, such as the mean. It is used to analyze variability in data.

Expected Value

The expected value is the weighted average of all possible values of a random variable, representing its long-term average outcome.

mathematical terms from a to z: The A-Z of Social Research Jargon David Robinson, Val Reed, 2019-05-23 First published in 1998, this volume examines a major function of research which is to strengthen the knowledge base of health professions and so enhance patient care. The rapid growth has unfortunately led to it being seen by many as an elitist activity full of jargon, carried out by academics. This to some degree has led to a theory practice gap with some professionals not recognising their important role within the research process. It is important to dispel the myth that all practitioner should carry out research, though they should use elements of the research process to develop a questioning and evaluative approach to care. This book will enable reader to demystify and enhance their understanding of terminology used in research and contains almost 300 terms. It offers readers a unique approach to explanations for each term by offering its Everyday use; its Research use; an Example and Related terms.

mathematical terms from a to z: Finance and the Behavioral Prospect James Ming Chen, 2016-10-01 This book explains how investor behavior, from mental accounting to the combustible interplay of hope and fear, affects financial economics. The transformation of portfolio theory begins with the identification of anomalies. Gaps in perception and behavioral departures from rationality spur momentum, irrational exuberance, and speculative bubbles. Behavioral accounting undermines the rational premises of mathematical finance. Assets and portfolios are imbued with “affect.” Positive and negative emotions warp investment decisions. Whether hedging against intertemporal changes in their ability to bear risk or climbing a psychological hierarchy of needs, investors arrange their portfolios and financial affairs according to emotions and perceptions. Risk aversion and life-cycle theories of consumption provide possible solutions to the equity premium puzzle, an iconic financial mystery. Prospect theory has questioned the cogency of the efficient capital markets hypothesis. Behavioral portfolio theory arises from a psychological account of security, potential, and aspiration.

mathematical terms from a to z: Computational Methods in Engineering & Science Zhenhan Yao, Mingwu Yuan, 2007-12-31 The 9th EPMESC was successfully held in Macao in November of 2003. At the end of the conference the Board of the EPMESC series decided that the next conference would be held in a city of the mainland of China. Also I was assigned to be the Chair person of the Conference. No doubt this is a great honor to me and also a challenge because there are so many professional international conferences in computational mechanics happening frequently in the world. After the successful organizing of WCCM6 in Beijing, September of 2004, I engaged to organize the 10th EPMESC. First of all, I had to choose the venue of the Conference. After some investigation and a lot of negotiation we went to see the site of the venue in Sanya, Hainan Island, the south-most city in China. Finally we made the decision. The most important reason for the choice was the ecological environment of this city. It is beneficial to our health after hard work. We scientists and engineers need a good relaxing place after working hard- a place to enjoy life with friends and family. Sanya is an ideal place and a real green city. Blue sky and white clouds, the peaceful sea and the long beach with white sand, shells and pearls, no pollution and no industry. Everything is so beautiful.

mathematical terms from a to z: The Parabolic Anderson Model Wolfgang König, 2016-06-30 This is a comprehensive survey on the research on the parabolic Anderson model – the heat equation with random potential or the random walk in random potential – of the years 1990 – 2015. The investigation of this model requires a combination of tools from probability (large deviations, extreme-value theory, e.g.) and analysis (spectral theory for the Laplace operator with potential, variational analysis, e.g.). We explain the background, the applications, the questions and the connections with other models and formulate the most relevant results on the long-time behavior of the solution, like quenched and annealed asymptotics for the total mass, intermittency, confinement and concentration properties and mass flow. Furthermore, we explain the most successful proof methods and give a list of open research problems. Proofs are not detailed, but

concisely outlined and commented; the formulations of some theorems are slightly simplified for better comprehension.

Cohen, 2008 This comprehensive graduate-level statistics text is aimed at students with a minimal background in the area or those who are wary of the subject matter. mathematical terms from a to z: From Calculus to Chaos David Acheson, 1997 What is calculus really for? This book is a highly readable introduction to applications of calculus, from Newton's time to the present day. These often involve questions of dynamics, i.e. of how - and why - things change with time. Problems of this kind lie at the heart of much of applied mathematics, physics, and engineering. From Calculus to Chaos takes a fresh approach to the subject as a whole, by moving from first steps to the frontiers, and by highlighting only the most important and interesting ideas, which can get lost amid a snowstorm of detail in conventional texts. The book is aimed at a wide readership, and assumes only some knowledge of elementary calculus. There are exercises (with full solutions) and simple but powerful computer programs which are suitable even for readers with no previous computing experience. David Acheson's book will inspire new students by providing a foretaste of more advanced mathematics and showing just how interesting the subject can be.

mathematical terms from a to z: The Logical Foundations of Statistical Inference Henry E. Kyburg Jr., 2012-12-06 Everyone knows it is easy to lie with statistics. It is important then to be able to tell a statistical lie from a valid statistical inference. It is a relatively widely accepted commonplace that our scientific knowledge is not certain and incorrigible, but merely probable, subject to refinement, modifi cation, and even overthrow. The rankest beginner at a gambling table understands that his decisions must be based on mathematical ex pectations - that is, on utilities weighted by probabilities. It is widely held that the same principles apply almost all the time in the game of life. If we turn to philosophers, or to mathematical statisticians, or to probability theorists for criteria of validity in statistical inference, for the general principles that distinguish well grounded from ill grounded generalizations and laws, or for the interpretation of that probability we must, like the gambler, take as our guide in life, we find disagreement, confusion, and frustration.

We might be prepared to find disagreements on a philosophical and theoretical level (although we do not find them in the case of deductive logic) but we do not expect, and we may be surprised to find, that these theoretical disagreements lead to differences in the conclusions that are regarded as 'acceptable' in the practice of science and public affairs, and in the conduct of business.

mathematical terms from a to z: Physical Aspects of Soil Water and Salts in Ecosystems

A. Hadas, Dale Swartzendruber, P.E. Rijtema, M. Fuchs, B. Yaron, 2012-12-06 The papers collected in this book were given and discussed at the symposium on Soil water physics and technology, which was held in Rehovot, Israel, from August 19th-September 4th, 1971. It was sponsored by the International Society of Soil Science (I.S.S.S.) through its Commissions I (soil physics) and VI (soil technology), and organized by the Israeli Soil Science Society. Thanks are due to the Editors for having assembled contributions and discussion remarks into a well-rounded, coherent book. The subjects covered in this book are the theoretical and practical aspects of the following topics: water movement in soils, soil-water interactions, evaporation from soil and plants, water requirements of crops, ion activity and migration in soils, soilwater management and salinity. In as much as these contributions were not solicited, they represent ideas and subjects considered important by the authors and debators. In science, one often finds a gap between basic research and practical application. If reading this book creates a feeling of an apparent lack of balance between theory and practice, this represents the state of our science today, and the thoughtful reader can and will recognize that much remains to be done. W. R. GARDNER T.J. MARSHAL President, Commission I President, Commission VI 1.5.5.5.
