mechanical engineering uva curriculum: The Renaissance Engineer of Tomorrow

European Society for Engineering Education. Conference, 2002 On the threshold of the 3rd Millennium, there can be no doubt about the fact that advances & progress of modern society are 'Technology driven'. There is still an ever increasing demand for Engineers at many different levels. Nonetheless, the skills and attitudes required of them are constantly changing, given that they must match developments which take place at an ever increasing rate. Hence, Engineering educators and, to greater extent, all stake-holders in the world of scientific and technological training are looking forward to the model of a more flexible, inter-disciplinary-shaped and innovation oriented kind of Engineers, perhaps an 'Artist-Engineer'. Is the ideal model - what we refer to as 'The Renaissance Engineer of Tomorrow' - a suitable one for the today times? Does such a model exist at all and, if yes, does it really satisfy the needs of our society? The 30th Sefi Annual Conference is a forum which is open for the development of such a discussion amongst scientists, educators, professionals, industrialists, students and all those involved and/or interested in the debate. Primarily, its purpose is to better identify and re-shape our concept of the ideal Engineer as envisaged for the future (no matter how we call such model!). Such a concept involves the ability to manage interaction between the many different branches of scientific and technical knowledge, as well as the skills associated with the adaptability and flexibility to handle tasks in a truly innovative manner, coupled with the positive attitude of life-long learning, ethical awareness and respect in our approach to a sustainable and socially-committed development, etc. All the above issues clearly define the profile of a graduate, far beyond the limited interpretation of the Anglo-Saxon word 'Engineer', i.e. challenging himself to change his/her perception of his/her role in the design process, as one moves beyond the simple act of making decisions based on codes and calculations. All this requires a multi-cultural education enriched through mobility during one's period of study, a marked team-work attitude in an international environment, the acceptance of challenging competitiveness in terms of ideas and improved efficiency of both processes and products: how does one go about developing all these graduate-skills through a simple Engineering degree? And how to solve the evident contradiction between the aspiration to educate an 'Artist Engineer' (necessarily, an elitary group) and the need of delivering a suitable technical education to the many young people who are requested in engineering, such to allow them to work and correctly and safely 'produce' for the society? More than 120 contributions responded to SEFIrenze 2002 call for papers from 30 different countries, almost all over the world. Their presence highlights the interest that the evocative issue of the 'Renaissance Engineer of Tomorrow' has drawn: everyone is dreaming something, figuring out his/her own idea of the task and handbut, perhaps, no single individual can really define, what it is exactly! Let us, therefore, dream of our future Engineers as people who will work with respect and awareness of different traditions and heritage. Let us envisage them as 'human bridges across different cultures and regions', linking people all over the world by means of science and technology. In this way, we can draw inspiration from our glorious Roman past, which teaches us that the Highest Authority, the Pontiff, took his privileged title from Pontifex Maximus, the ancient latin 'Pontesfacere', i.e., the Bridge maker! (Claudio Borri).

mechanical engineering uva curriculum: Proceedings of the Materials Forum 2007 National Research Council, Division on Engineering and Physical Sciences, National Materials Advisory Board, Corrosion Education Workshop Organizing Panel, 2007-06-29 The U.S. industrial complex and its associated infrastructure are essential to the nation's quality of life, its industrial productivity, international competitiveness, and security. Each component of the infrastructure-such as highways, airports, water supply, waste treatment, energy supply, and power generation-represents a complex system requiring significant investment. Within that infrastructure both the private and government sectors have equipment and facilities that are subject to degradation by corrosion, which significantly reduces the lifetime, reliability, and functionality of structures and equipment, while also threatening human safety. The direct costs of corrosion to the U.S. economy represent 3.2 percent of the gross domestic product (GDP), and the total costs to

society can be twice that or greater. Opportunities for savings through improved corrosion control exist in every economic sector. The workshop, Corrosion Education for the 21st Century, brought together corrosion specialists, leaders in materials and engineering education, government officials, and other interested parties. The workshop was also attended by members of NRC's Committee on Assessing Corrosion Education, who are carrying out a study on this topic. The workshop panelists and speakers were asked to give their personal perspectives on whether corrosion abatement is adequately addressed in our nation's engineering curricula and, if not, what issues need to be addressed to develop a comprehensive corrosion curriculum in undergraduate engineering. This proceedings consists of extended abstracts from the workshop's speakers that reflect their personal views as presented to the meeting. Proceedings of the Materials Forum 2007: Corrosion Education for the 21st Century summarizes this form.

mechanical engineering uva curriculum: Aerospace Engineering Education During the First Century of Flight Barnes Warnock McCormick, Conrad F. Newberry, Eric Jumper, 2004 On 17 December 1903 at Kitty Hawk, NC, the Wright brothers succeeded in achieving controlled flight in a heavier-than-air machine. This feat was accomplished by them only after meticulous experiments and a study of the work of others before them like Sir George Cayley, Otto Lilienthal, and Samuel Langley. The first evidence of the academic community becoming interested in human flight is found in 1883 when Professor J. J. Montgomery of Santa Clara College conducted a series of glider tests. Seven years later, in 1890, Octave Chanute presented a number of lectures to students of Sibley College, Cornell University entitled Aerial Navigation. This book is a collection of papers solicited from U. S. universities or institutions with a history of programs in Aerospace/Aeronautical engineering. There are 69 institutions covered in the 71 chapters. This collection of papers represents an authoritative story of the development of educational programs in the nation that were devoted to human flight. Most of these programs are still in existence but there are a few papers covering the history of programs that are no longer in operation. documented in Part I as well as the rapid expansion of educational programs relating to aeronautical engineering that took place in the 1940s. Part II is devoted to the four schools that were pioneers in establishing formal programs. Part III describes the activities of the Guggenheim Foundation that spurred much of the development of programs in aeronautical engineering. Part IV covers the 48 colleges and universities that were formally established in the mid-1930s to the present. The military institutions are grouped together in the Part V; and Part VI presents the histories of those programs that evolved from proprietary institutions.

mechanical engineering uva curriculum: Chewing the Wafer William C Jeffries, 2020-03-23
Whatever our calling in life, our Christian faith should be evident in what we say and what we do; our world view should be crystal clear. Those who know me, expect my books to be about leadership, organizational performance, and high performance teams. This book is about taking our faith to work. There is nothing special about me; that is the point. Even those of us living and working off the radar as cooks at Chick-fil-A, cashiers at Walmart, college professors, business leaders, union mechanics, engineers, safety inspectors at NASA, or for some of us, even serving as advisors to senior business leaders and foreign royalty, have the opportunity to have our lives speak for the Christ who redeemed us. After all, our Lord came to redeem all of life, not just the time we spend in church. The question for me is, am I an international consultant who happens to be a Christian, or a Christian who chooses to be a consultant? Which option I choose has specific implications for how I should live and work. In one way or another, that is the choice afforded to each of us. What set of underlying considerations drives us; what set of presuppositions underscores our lives? What is our essential ontology, and why have we been created? Each of us should examine those things we do and the lives we live to ensure they can be clearly reflective of a Christian world view. If they cannot, it is time for a career change. How does such a world view develop? Where does it come from? Because it is from the many stories in our lives that our eventual world view is constructed, I will tell many stories and discuss how they contributed to the creation of an authentic Christian world view.
