pompeii museum of science and industry: Life on Display Karen A. Rader, Victoria E.M. Cain, 2014-10-03 Rich with archival detail and compelling characters, *Life on Display* uses the history of biological exhibitions to analyze museums' shifting roles in twentieth-century American science and society. Karen A. Rader and Victoria E. M. Cain chronicle profound changes in these exhibitions—and the institutions that housed them—between 1910 and 1990, ultimately offering new perspectives on the history of museums, science, and science education. Rader and Cain explain why science and natural history museums began to welcome new audiences between the 1900s and the 1920s and chronicle the turmoil that resulted from the introduction of new kinds of biological displays. They describe how these displays of life changed dramatically once again in the 1930s and 1940s, as museums negotiated changing, often conflicting interests of scientists, educators, and visitors. The authors then reveal how museum staffs, facing intense public and scientific scrutiny, experimented with wildly different definitions of life science and life science education from the 1950s through the 1980s. The book concludes with a discussion of the influence that corporate sponsorship and blockbuster economics wielded over science and natural history museums in the century's last decades. A vivid, entertaining study of the ways science and natural history museums shaped and were shaped by understandings of science and public education in the twentieth-century

United States, Life on Display will appeal to historians, sociologists, and ethnographers of American science and culture, as well as museum practitioners and general readers.

Hot topics such as homosexuality, sexual, and racial violence, massacres, drugs, terrorism, GMO foods, H1N1 (swine flu) and climate change are now all part of museological culture. The authors in this collection situate cultural institutions in an increasingly interconnected, complex, globalising and uncertain world and engage the why and how institutions might form part of, activate conversations and action through discussions that theorise institutions in new ways to the very practical means in which institutions might engage their constituencies.

pompeii museum of science and industry: Aesthetics, Industry & Science M. Norton Wise, 2018-06-15 On January 5, 1845, the Prussian cultural minister received a request by a group of six young men to form a new Physical Society in Berlin. In fields from thermodynamics, mechanics, and electromagnetism to animal electricity, ophthalmology, and psychophysics, members of this small but growing group—which soon included Emil Du Bois-Reymond, Ernst Brücke, Werner Siemens, and Hermann von Helmholtz—established leading positions in what only thirty years later had become a new landscape of natural science. How was this possible? How could a bunch of twenty-somethings succeed in seizing the future? In *Aesthetics, Industry, and Science* M. Norton Wise answers these questions not simply from a technical perspective of theories and practices but with a broader cultural view of what was happening in Berlin at the time. He emphasizes in

particular how rapid industrial development, military modernization, and the neoclassical aesthetics of contemporary art informed the ways in which these young men thought. Wise argues that aesthetic sensibility and material aspiration in this period were intimately linked, and he uses these two themes for a final reappraisal of Helmholtz's early work. Anyone interested in modern German cultural history, or the history of nineteenth-century German science, will be drawn to this landmark book.
