This embodied solution reveals the patterns and principles that unite languages across modalities. Using a multidisciplinary approach, Wilcox explores such issues as the how to apply cognitive grammar to the study of signed languages, the pervasive conceptual iconicity present throughout the lexicon and grammar of signed languages, the relation of language and gesture, the grammaticization of signs, the significance of motion for understanding language as a dynamic system, and the integration of cognitive neuroscience and cognitive linguistics.

pool in sign language: **From Oppression to Grace** Theodorea Regina Berry, Nathalie Mizelle, 2023-07-03 This book gives voice to the experiences of women of color--women of African, Native American, Latina, East Indian, Korean and Japanese descent--as students pursuing terminal degrees and as faculty members navigating the Academy, grappling with the dilemmas encountered by others and themselves as they exist at the intersections of their work and identities. Women of color are frequently relegated--on account both of race and womanhood--into monolithic categories that perpetuate oppression, subdue and suppress conflict, and silence voices. This book uses critical race feminism (CRF) to place women of color in the center, rather than the margins, of the discussion, theorizing, research and praxis of their lives as they co-exist in the dominant culture. The first part of the book addresses the issues faced on the way to achieving a terminal degree: the struggles encountered and the lessons learned along the way. Part Two, *Pride and Prejudice: Finding Your Place After the Degree* describes the complexity of lives of women with multiple identities as scholars with family, friends, and lives at home and at work. The book concludes with the voices of senior faculty sharing their journeys and their paths to growth as scholars and individuals. This book is for all women of color growing up in the academy, learning to stand on their own, taking first steps, mastering the language, walking, running, falling and getting up to run again--and illuminates the process of self-definition that is essential to their growth as scholars and individuals.

Miyashita, Edmund T. Rolls, 1997-05-29 The topic of consciousness is truly multidisciplinary, attracting researchers and theorists from diverse backgrounds. It is now widely accepted that previously disparate areas all have contributions to make to the understanding of the nature of consciousness. Thus, we now have computational scientists, neuroscientists, and philosophers all engaged in the same effort. This book illustrates these three approaches, with chapters provided by some of the most important and provocative figures in the field. The first section is concerned with philosophical approaches to consciousness. One of the fundamental issues here is that of subjective feeling or qualia. The second section focuses on approaches from cognitive neuroscience. Patients with different types of neurological problems, and new imaging techniques, provide rich sources of data for studying how consciousness relates to brain function. The third section includes computational approaches looking at the quantitative relationship between brain processes and conscious experience. *Cognition, Computation, and Consciousness* represents a uniquely integrated and current account of this most fascinating and intractable subject.

pool in sign language: Assessing Literacy in Deaf Individuals Donna Morere, Thomas Allen, 2012-12-09 Humans' development of literacy has been a recent focus of intense research from the reading, cognitive, and neuroscience fields. But for individuals who are deaf—who rely greatly on their visual skills for language and learning—the findings don't necessarily apply, leaving theoretical and practical gaps in approaches to their education. *Assessing Literacy in Deaf Individuals: Neurocognitive Measurement and Predictors* narrows these gaps by introducing the VL2 Toolkit, a comprehensive test battery for assessing the academic skills and cognitive functioning of deaf persons who use sign language. Skills measured include executive functioning, memory, reading, visuospatial ability, writing fluency, math, and expressive and receptive language. Comprehensive data are provided for each, with discussion of validity and reliability issues as well as ethical and legal questions involved in the study. And background chapters explain how the Toolkit was compiled, describing the procedures of the study, its rationale, and salient characteristics of its participants. This notable book: Describes each Toolkit instrument and the psychometric properties it measures. Presents detailed findings on test measures and relationships between skills. Discusses issues and challenges relating to visual representations of English, including fingerspelling and lipreading. Features a factor analysis of the Toolkit measures to identify underlying cognitive structures in deaf learners. Reviews trends in American Sign Language assessment. *Assessing Literacy in Deaf Individuals* is an essential reference for researchers, graduate students, clinicians, and other professionals working in the field of deafness and deaf education across in such areas as clinical child and school psychology, audiology, and linguistics.
