Importance of Pre Op Diet for Sleeve

The pre op diet for sleeve gastrectomy plays a vital role in surgical preparation by optimizing the patient's physical condition. One of the primary objectives is to reduce the size of the liver to improve visibility and access during surgery. A smaller liver decreases the risk of complications such as bleeding and facilitates a smoother procedure. Moreover, adhering to a structured diet helps stabilize blood sugar levels and minimizes inflammation, which supports faster healing postoperatively. Nutrition is also critical for maintaining muscle mass and energy levels, which are essential for recovery. The preoperative diet serves as a foundation for adopting healthier eating habits necessary for long-term weight management after sleeve gastrectomy.

Phases of the Preoperative Diet

The pre op diet for sleeve typically involves several phases designed to gradually transition the patient from a normal diet to a surgical-ready nutritional state. Each phase has specific goals and dietary restrictions to optimize body composition and prepare the gastrointestinal system for surgery.

Initial Phase: Regular Diet Modification

During this phase, patients begin reducing calorie intake and limiting high-fat and high-sugar foods. The focus is on adopting a balanced diet rich in lean proteins, vegetables, and whole grains. This period usually lasts one to two weeks and aims to initiate weight loss and improve metabolic parameters.

Liquid Diet Phase

Approximately one to two weeks before surgery, patients switch to a liquid diet. This phase helps shrink the liver and reduce intra-abdominal fat. Liquids typically include protein shakes, clear broths,

and sugar-free beverages. Solid foods are eliminated to ease digestion and prepare the stomach for the upcoming procedure.

Clear Liquid Diet 24 Hours Before Surgery

In the final 24 hours, patients follow a strict clear liquid diet. This means consuming only transparent fluids like water, herbal tea, and clear broth. This step ensures the stomach is empty during surgery, reducing the risk of aspiration and other complications.

Recommended Foods and Nutritional Guidelines

A well-structured pre op diet for sleeve should prioritize nutrient-dense foods that support weight loss while maintaining muscle and organ function. Protein intake is especially important to preserve lean body mass during calorie restriction.

High-Protein Foods

Protein is essential for tissue repair and immune function. Recommended choices include:

- Lean poultry such as chicken or turkey
- Fish and seafood
- Low-fat dairy products like Greek yogurt and cottage cheese

- Egg whites
- Plant-based proteins such as tofu and legumes

Vegetables and Low-Carbohydrate Options

Non-starchy vegetables provide fiber, vitamins, and minerals without excessive calories. Incorporate leafy greens, broccoli, cauliflower, and peppers. Limiting carbohydrates helps reduce liver fat and promotes weight loss.

Healthy Fats

Small amounts of healthy fats support hormone production and satiety. Sources include avocados, nuts, seeds, and olive oil. These should be consumed in moderation during the preoperative period.

Foods and Habits to Avoid Before Surgery

To ensure optimal surgical conditions and reduce complications, certain foods and behaviors must be avoided in the pre op diet for sleeve.

High-Fat and Fried Foods

These foods are difficult to digest and can increase liver fat, making surgery more challenging. Avoid fast food, fried items, and high-fat dairy products.

Sugary Foods and Beverages

Sugar promotes inflammation and weight gain, which can impair surgical outcomes. Eliminate sweets, soda, and fruit juices with added sugars.

Alcohol and Smoking

Alcohol negatively affects liver function and hydration, while smoking increases the risk of respiratory complications and delayed healing. Both should be discontinued well in advance of surgery.

Large Meals and Overeating

Consuming large portions can stretch the stomach and increase fat deposits around the liver. Smaller, frequent meals are recommended to maintain steady blood sugar and reduce gastric volume.

Hydration and Supplementation

Maintaining proper hydration is critical during the preoperative period. Dehydration can complicate anesthesia and recovery. Patients should aim to drink at least 64 ounces of water daily unless otherwise directed by their healthcare provider.

Vitamin and Mineral Supplements

Some surgeons recommend specific supplements before surgery to correct nutritional deficiencies and

support healing. Common supplements include:

- Multivitamins
- Vitamin D
- Iron
- Calcium
- Vitamin B12

It is important to follow the surgeon or dietitian's guidance on supplementation to avoid interactions or excess intake.

Tips for Managing the Pre Op Diet

Adhering to the pre op diet for sleeve can be challenging, but the following strategies may improve compliance and comfort.

- **Protein Shakes:** Use commercially available or homemade protein shakes to meet protein goals easily.

pre op diet for sleeve: Understanding Obesity to Determine the Best Therapeutic Option: From Lifestyle Interventions to Therapies Evelyn Frias-Toral, Jorge Carriel-Mancilla, Florencia Ceriani, Almino Ramos, 2025-02-21 We are currently facing an obesity pandemic that affects individuals of all age groups, geographic areas, and social status, among others. Thus, it is essential to generate high-quality scientific evidence to better understand this pathology, its risk factors, and its treatments. Several modifiable and non-modifiable risk factors for the development of obesity have been identified. It has been demonstrated that obese patients have an increased risk of acquiring arterial hypertension, diabetes, dyslipidemia, cardiovascular diseases, cancer, and other chronic conditions. In order to take efficient actions to reverse or prevent these complications, it is also crucial to delve into body composition, lean mass, fat, bone mass, and sarcopenia in patients with obesity. In recent months, there have been developments in pharmacological therapies using GLP-1, GIP, and glucagon agonists, which seem to change the rules of the game regarding therapeutic decision-making in these patients worldwide. However, surgical techniques such as sleeve gastrectomy and Roux-en-Y gastric bypass continue to be the most effective and definitive interventions to achieve adequate weight loss in patients with obesity. Despite the pharmacological development, none of the clinical trials have shown that the operated patients reach more than 30% of the total body weight, as with bariatric surgery techniques. Furthermore, it is fundamental to analyze the impact of diverse therapeutic, non-surgical, and non-pharmacological options to address obesity, such as cognitive-behavioral interventions and different types of diets in combination with physical activity.
