pre health science major: Strategic Shakespeare Ariane M. Balizet, Natalie K. Eschenbaum, Marcela Kostihová, 2025-05-30 Strategic Shakespeare demonstrates the value of humanities-trained scholars as leaders in higher education. It features contributions from Renaissance and Shakespearean scholars in leadership roles in North American higher education, who collectively aim to leverage traditional assumptions about Shakespeare in the service of a more inclusive and sustainable academy. Making a powerful case for the liberal arts, the contributors demonstrate ways in which training in the humanities creates a baseline of skills in collaboration, deep listening, tolerance for ambiguity, and a range of positionalities. They also illustrate an astute understanding of disparate data sets, persuasive storytelling, and a commitment to liberal arts education. As this innovative collection showcases, these skills are crucial in the current climate, as higher education struggles with declining enrolments, decreasing budgets, growing public distrust, and (often) hostile legislative oversight. Additionally, the skills help us navigate a rapidly shifting landscape of learning in the aftermath of the COVID-19 pandemic and entry of generative artificial intelligence (AI) to the public sphere. The collection presents theoretical arguments, case studies, personal narratives, and practical advice related to how humanities-trained scholars have led and must continue to lead the academy through transformative change. Strategic Shakespeare is an essential tool for anyone interested in learning from university leaders who have made good things happen on their campuses, in their communities, and in the profession. It celebrates and foregrounds the core adaptive skills that humanities scholars bring to the table, showcasing their unique predisposition for successful academic leadership during a time of unprecedented change.

pre health science major: Structural Competency in Mental Health and Medicine Helena Hansen, Jonathan M. Metzl, 2019-03-28 This book documents the ways that clinical practitioners and trainees have used the "structural competency" framework to reduce inequalities in health. The essays describe on-the-ground ways that clinicians, educators, and activists craft structural interventions to enhance health outcomes, student learning, and community organizing around issues of social justice in health and healthcare. Each chapter of the book begins with a case study that illuminates a competency in reorienting clinical and public health practice toward community, institutional and policy level intervention based on alliances with social agencies, community organizations and policy makers. Written by authors who are trained in both clinical and social sciences, the chapters cover pedagogy in classrooms and clinics, community collaboration, innovative health promotion approaches in non-health sectors and in public policies, offering a view

of effective care as structural intervention and a road map toward its implementation. Structural Competency in Mental Health and Medicine is a cutting-edge resource for psychiatrists, primary care physicians, addiction medicine specialists, emergency medicine specialists, nurses, social workers, public health practitioners, and other clinicians working toward equality in health.

pre health science major: Centering Humanism in STEM Education Bryan Dewsbury, Susannah McGowan, Sheila S. Jaswal , Desiree Forsythe, 2024-09-24 Research demonstrates that STEM disciplines perpetuate a history of exclusion, particularly for students with marginalized identities. This poses problems particularly when science permeates every aspect of contemporary American life. Institutions' repeated failures to disrupt systemic oppression in STEM has led to a mostly white, cisgender, and male scientific workforce replete with implicit and/or explicit biases. Education holds one pathway to disrupt systemic linkages of STEM oppression from society to the classroom. Maintaining views on science as inherently objective isolates it from the world in which it is performed. STEM education must move beyond the transactional approaches to transformative environments manifesting respect for students' social and educational capital. We must create a STEM environment in which students with marginalized identities feel respected, listened to, and valued. We must assist students in understanding how their positionality, privilege, and power both historically and currently impacts their meaning making and understanding of STEM.

pre health science major: Women and Men of the Engineering Path Clifford Adelman, 1998 This monograph provides college academic administrators, institutional researchers, professional and learned societies, and academic advisors with information to improve understanding of the paths students take through engineering programs in higher education. The evidence used in this study comes principally from the 11-year college transcript history (1982-1993) of the High School & Beyond/Sophomore Cohort Longitudinal Study, as well as the high school transcripts, test scores, and surveys of this nationally representative sample. This is the first national tracking study of students in any undergraduate discipline that identifies attempted major fields from the empirical evidence of college transcripts. A curricular threshold of engineering was defined, and the careers of students described with reference to that threshold. While 16 long-term destinations of students who reached the threshold are identified, they are collapsed into four for

purposes of analysis: (1) thresholders, who never moved beyond the requisite entry courses; (2) migrants, who crossed the threshold of the engineering path, began to major in engineering, but switched to other fields or left college altogether; (3) completers, some of whom continued on to graduate school by age 30; and (4) two-year-only students, whose college experience was confined principally to engineering tech programs in community colleges. Findings are presented in seven parts: (1) Engineering Paths as Established by Students; (2) The Content of Their Curriculum; (3) Engineering and Science: Confusing Signs along the Path; (4) Antecedents of the Engineering Path; (5) Choosing the Engineering Path; (6) Learning Engineering: Migration and Traffic; and (7) Experiencing Engineering: Classroom Environments, Credit Loads, and Grades. A concluding section presents suggestions for changing the image of engineering among high school students and potential college majors, particularly women. Suggestions are also provided to other disciplines for undertaking similar tracking studies, particularly in fields where men have been a distinct minority. Contains 131 references and an appendix.
