principles of neural science 6th edition: From Sensing to Sentience Todd E. Feinberg, 2024-10-01 A new theory of Neurobiological Emergentism that explains how sentience emerges from the brain. Sentience is the feeling aspect of consciousness. In From Sensing to Sentience, Todd Feinberg develops a new theory called Neurobiological Emergentism (NBE) that integrates biological, neurobiological, evolutionary, and philosophical perspectives to explain how sentience naturally emerges from the brain. Emergent properties are broadly defined as features of a complex system that are not present in the parts of a system when they are considered in isolation but may emerge as a system feature of those parts and their interactions. Tracing a journey of billions of years of evolution from life to the basic sensing capabilities of single-celled organisms up to the sentience of animals with advanced nervous systems, including all vertebrates (for instance, fish, reptiles, birds, and mammals), arthropods (insects and crabs), and cephalopods such as the octopus, Feinberg argues that sentience gradually but eventually emerged along diverse evolutionary lines with the evolution of sufficiently neurobiologically complex brains during the Cambrian period over 520 million years ago. Ultimately, Feinberg argues that viewing sentience as an emergent process can explain both its neurobiological basis as well its perplexing personal nature, thus solving the historical philosophical problem of the apparent “explanatory gap” between the brain and experience.

principles of neural science 6th edition: Our Brains, Our Selves Masud Husain, 2025-02-13 WINNER OF THE ROYAL SOCIETY TRIVEDI SCIENCE BOOK PRIZE What makes us who we are? Is it our background that creates our identities? Or our families, where we lived, how we were brought up and educated, the jobs we’ve held? Yes, all of the above, but more fundamental than any of these is our brain. This is never more evident than if we lose even a single one of our cognitive abilities. People who develop a brain disorder can find that their identity, their sense of self, can undergo dramatic changes. Through the stories of seven of his patients, acclaimed Oxford University neurologist Masud Husain shows us how our brains create our identity, how that identity can be changed, and sometimes even be restored. Among the people we encounter is a man who ran out of words, a woman who stopped caring what others thought of her and another who, losing her memory, started to believe she was having an affair with the man who was really her husband. These compelling human dramas reveal how our identities are created by different functions within the brain. They show how modern neuroscience can help to explain the changes in behaviour that occur when our perception, attention, memory, motivation or empathy are altered. By understanding how

our brains normally function, neurologists are bringing hope to patients with brain disorders and illuminating the human experience. The resulting journey will ignite new ideas about who we really are and why we act in the ways we do.

principles of neural science 6th edition: *Neurocognitive Foundations of Mind* Gualtiero Piccinini, 2025-09-18 This volume provides a cohesive and comprehensive case that cognitive neuroscience is maturing into an integrated, interdisciplinary science that is transforming our understanding of the mind. The rise of cognitive neuroscience has prompted a rethinking of levels, computation, representation, psychological explanation, and the relation between psychology and neuroscience. Despite these advances, many philosophers and scientists of the mind continue to write as though cognitive neuroscience didn't exist and psychology remains autonomous from neuroscience or, perhaps, they maintain that cognitive neuroscience has not deepened our understanding of the mind. The chapters in this volume showcase important ways in which cognitive neuroscience makes a profound difference to our understanding of the mind. The contributors address a wide range of topics, including explanation, computation, representation, inference, emotion, language, intention, and thought. Together, they demonstrate the ways in which cognitive neuroscience supersedes traditional cognitive science and supports a unified, integrated, multilevel, mechanistic, neurocomputational account of the mind. *Neurocognitive Foundations of Mind* is essential reading for scholars and advanced students interested in the foundations of the philosophy of mind and the mind sciences.
