technology experts in the area of process design: [] With Design: Reinventing Design Modes Gerhard Bruyns, Huaxin Wei, 2022-11-05 This collection stems from the International Association of Societies of Design Research (IASDR) congress in 2021, promoting the research of design in its many fields of application. Today's design finds itself at a critical moment where the conventional 'modes' of doing, thinking and application are increasingly challenged by the troubled ideology of globalisation, climate change, migration patterns and the rapid restructuring of locally driven manufacturing sectors. The volume presents a selection of papers on state-of-the-art design research work. As rapid technological development has been pushing and breaking new ground in society, the broad field of design is facing many unprecedented changes. In combination with the environmental, cultural, technological, and, crucially, pandemic transitions, design at large is called to fundamentally alter its modes of practice. Beyond the conventional models of conducting research, or developing solutions to 'wicked' problems, the recoupling of design with different modes should be seen as an expression to embrace other capacities of thinking, criticisms and productions. This selection of proceedings papers delivers the latest insights into design from a multitude of perspectives, as reflected in the eight thematic modes of the congress ; i.e., [social] , [making] , [business] , [critical], [historical/projective], [impact], [pandemic], and [alternative] with design modes. The book benefits design researchers from both academia and industry who are interested in the latest design research results, as well as in innovative design research methods. In presenting an interesting corpus of design case studies as well as studies of design impact, this comprehensive collection is of relevance to design theorists and students, as well as scholars in related fields seeking to understand how design plays a critical role in their respective domains.

technology experts in the area of process design: Rethink! Prototyping Christoph Gengnagel, Emilia Nagy, Rainer Stark, 2015-11-18 In this book, the authors describe the findings derived from interaction and cooperation between scientific actors employing diverse practices.

They reflect on distinct prototyping concepts and examine the transformation of development culture in their fusion to hybrid approaches and solutions. The products of tomorrow are going to be multifunctional, interactive systems – and already are to some degree today. Collaboration across multiple disciplines is the only way to grasp their complexity in design concepts. This underscores the importance of reconsidering the prototyping process for the development of these systems, particularly in transdisciplinary research teams. “Rethinking Prototyping – new hybrid concepts for prototyping” was a transdisciplinary project that took up this challenge. The aim of this programmatic rethinking was to come up with a general concept of prototyping by combining innovative prototyping concepts, which had been researched and developed in three sub-projects: “Hybrid Prototyping” developed new prototyping approaches to validate and evaluate holistically developed systems with their services, infrastructure and business models. “Blended Prototyping” addressed a new technique whereby prototypes for user interfaces of software applications can be generated from hand drawings and immediately be tested. “Beyond Prototyping” examined the issue of the prototype in connection with algorithmically generated design for producing tailor-made products.
