

technology capital of the world

technology capital of the world is a term often associated with cities or regions that lead innovation, technological development, and digital transformation on a global scale. This designation highlights the concentration of tech companies, startups, research institutions, venture capital, and skilled talent in one area. Understanding what makes a place the technology capital of the world requires exploring various factors such as infrastructure, economic environment, innovation culture, and educational ecosystems. This article delves into the key contenders for the title, the defining characteristics of technology hubs, and the global impact of these centers of innovation. Additionally, the discussion covers the economic implications, major players, and future trends shaping the technology capital of the world. The following sections provide a comprehensive overview of this dynamic and rapidly evolving subject.

- Defining the Technology Capital of the World
- Leading Contenders for the Technology Capital of the World
- Key Characteristics of a Technology Capital
- Economic Impact of Technology Capitals
- Major Technology Sectors Driving Innovation
- Future Trends and Emerging Technology Hubs

Defining the Technology Capital of the World

The term technology capital of the world refers to the city or region recognized globally as the primary center for technological innovation, development, and commercialization. This definition extends beyond mere concentration of tech companies to include factors such as research output, venture capital availability, startup activity, infrastructure, and talent pool. The technology capital typically serves as a global hub for innovation, attracting entrepreneurs, investors, and researchers seeking to push the boundaries of science and technology. It also acts as a catalyst for economic growth and shapes global technology trends.

Criteria for Evaluation

Determining the technology capital involves assessing multiple criteria that collectively define a region's technological ecosystem. These criteria include:

- **Concentration of Tech Companies:** Presence of leading multinational tech corporations and numerous startups.
- **Research and Development:** High levels of R&D spending and output, including patents and scientific publications.

- **Venture Capital Investment:** Availability and volume of funding for tech ventures and startups.
- **Talent Pool:** Access to skilled professionals, engineers, and innovators.
- **Infrastructure:** Advanced digital infrastructure and support systems for technology development.
- **Government and Policy Support:** Favorable policies, incentives, and regulatory environment.

Leading Contenders for the Technology Capital of the World

Several cities around the globe compete for the title of technology capital of the world, each offering unique advantages and strengths. These hubs have become synonymous with cutting-edge technology, innovation ecosystems, and economic vitality driven by the tech sector.

Silicon Valley, United States

Silicon Valley, located in the San Francisco Bay Area of California, remains the most iconic and widely recognized technology capital of the world. It is home to giants like Apple, Google, Facebook (Meta), and thousands of startups. Characterized by a dense network of venture capital firms, top-tier universities such as Stanford, and a culture of innovation, Silicon Valley has shaped the global technology landscape for decades.

Shenzhen, China

Shenzhen has rapidly emerged as a formidable technology hub in Asia. Known as China's hardware manufacturing powerhouse, Shenzhen houses major companies like Huawei, Tencent, and DJI. The city benefits from strong government support, extensive manufacturing infrastructure, and a growing ecosystem of tech startups, making it a critical player in global technology innovation.

Bangalore, India

Often referred to as the "Silicon Valley of India," Bangalore is a major center for software development, IT services, and innovation. It boasts a large talent pool, numerous multinational IT companies, and vibrant startup culture. Bangalore's growth is supported by educational institutions and government initiatives aimed at fostering technology entrepreneurship.

Other Notable Technology Hubs

Besides these leaders, other cities such as Tokyo, Berlin, Tel Aviv, and London have significant technology sectors and contribute substantially to global innovation. Each offers specialized strengths in areas like robotics,

cybersecurity, fintech, and artificial intelligence.

Key Characteristics of a Technology Capital

Understanding what makes a city the technology capital of the world involves analyzing the ecosystem components that foster innovation and technological advancement.

Innovation Ecosystem

A thriving innovation ecosystem integrates academia, industry, government, and finance to support research, development, and commercialization of new technologies. Collaboration among these sectors accelerates innovation and attracts global talent and investment.

Access to Capital

Availability of venture capital and funding sources is essential for startups and tech companies to grow and scale. Technology capitals typically feature a robust financial environment with numerous venture capital firms, angel investors, and corporate investment arms.

Talent and Education

Highly skilled professionals drive technological progress. Leading technology capitals benefit from top universities, research institutions, and continuous talent development programs that supply engineers, scientists, and entrepreneurs.

Supportive Infrastructure and Policies

Advanced digital infrastructure, including broadband networks, data centers, and transportation, supports tech activities. Additionally, government policies that encourage innovation, protect intellectual property, and reduce bureaucratic hurdles play a crucial role.

Economic Impact of Technology Capitals

The economic influence of the technology capital of the world extends beyond the tech sector, affecting regional and global economies through job creation, GDP growth, and technological spillovers.

Job Creation and Workforce Development

Technology hubs generate millions of jobs not only within the tech industry but also in supporting sectors such as services, manufacturing, and retail. The demand for skilled labor drives education and training programs, contributing to workforce development.

Contribution to GDP and Innovation Output

Regions recognized as technology capitals contribute disproportionately to national and global GDP. They are also centers of innovation output measured by patents, publications, and new product launches that stimulate economic competitiveness.

Global Competitiveness

Technology capitals enhance a country's position in the global economy by attracting foreign direct investment, fostering international partnerships, and leading in emerging technology markets.

Major Technology Sectors Driving Innovation

The technology capital of the world is often characterized by dominance in specific tech sectors that drive innovation and economic growth.

Information Technology and Software Development

This sector includes software engineering, cloud computing, data analytics, and cybersecurity. It forms the backbone of many technology capitals with widespread applications across industries.

Hardware and Electronics Manufacturing

Regions like Shenzhen specialize in hardware innovation, including semiconductors, consumer electronics, and telecommunications equipment, providing critical components for global supply chains.

Biotechnology and Health Tech

Emerging as a significant sector, biotechnology and health technology involve innovations in pharmaceuticals, medical devices, and digital health solutions, often supported by strong research institutions.

Artificial Intelligence and Robotics

AI and robotics are transforming industries through automation, machine learning, and intelligent systems. Technology capitals invest heavily in these areas to maintain technological leadership.

Future Trends and Emerging Technology Hubs

The landscape of the technology capital of the world is evolving with new trends and emerging centers challenging traditional leaders.

Rise of New Technology Hubs

Emerging cities in Southeast Asia, Latin America, and Eastern Europe are developing vibrant tech ecosystems supported by local entrepreneurship, government incentives, and increasing investment.

Focus on Sustainability and Green Technology

Technology capitals are increasingly prioritizing sustainable innovation, including renewable energy, smart cities, and environmental technologies, addressing global challenges and creating new economic opportunities.

Global Collaboration and Digital Connectivity

Advances in digital communication and remote work are fostering global collaboration networks, enabling technology capitals to extend their influence and integrate with worldwide innovation communities.

Frequently Asked Questions

What city is commonly referred to as the technology capital of the world?

Silicon Valley, located in the San Francisco Bay Area of California, is commonly referred to as the technology capital of the world.

Why is Silicon Valley considered the technology capital of the world?

Silicon Valley is considered the technology capital of the world due to its high concentration of tech companies, startups, venture capital, and innovation hubs that have driven advancements in computing, software, and internet technologies.

Which major technology companies are headquartered in the technology capital of the world?

Major technology companies headquartered in Silicon Valley include Apple, Google (Alphabet), Facebook (Meta), Intel, and Cisco Systems.

How has Silicon Valley influenced global technological innovation?

Silicon Valley has influenced global technological innovation by fostering a culture of entrepreneurship, providing access to venture capital, attracting top talent, and pioneering groundbreaking technologies in areas like semiconductors, software, and social media.

Are there other cities competing to be the technology capital of the world?

Yes, cities like Shenzhen, Beijing, Bangalore, and Tel Aviv are rapidly growing as technology hubs and are often considered contenders for the title due to their booming tech industries and innovation ecosystems.

What role do universities play in maintaining Silicon Valley as the technology capital?

Universities such as Stanford and UC Berkeley play a critical role by conducting cutting-edge research, fostering entrepreneurship, and supplying a steady stream of skilled graduates to Silicon Valley companies.

How is the technology capital of the world evolving with emerging technologies?

The technology capital of the world is evolving by integrating emerging technologies like artificial intelligence, quantum computing, biotechnology, and clean energy innovations, ensuring continued leadership in global technology development.

Additional Resources

1. Silicon Valley: The Heartbeat of Innovation

This book delves into the history and evolution of Silicon Valley as the global technology capital. It explores the key companies, influential entrepreneurs, and groundbreaking inventions that have shaped the region. Readers gain insight into the unique culture and environment that foster continuous innovation.

2. The Rise of Tech Titans: How Innovation Built the World's Technology Hub

Focusing on the major players in the tech industry, this book chronicles the journeys of companies like Apple, Google, and Facebook. It discusses how their innovations transformed the global economy and positioned their home regions as technology capitals. The narrative highlights strategic decisions and pivotal moments that defined the tech landscape.

3. From Garage to Greatness: Stories of Startup Success

This collection of inspiring stories showcases startups that began in humble settings and grew into influential technology leaders. It examines the entrepreneurial spirit, challenges, and breakthroughs that characterize the technology capital of the world. The book also provides lessons for aspiring innovators and business leaders.

4. Innovate or Die: The Competitive Edge of the Technology Capital

Exploring the relentless pace of innovation, this book analyzes how companies and regions maintain their status as technology capitals. It discusses the role of research and development, venture capital, and government policies in sustaining technological leadership. Readers will understand the pressures and strategies behind staying ahead in a fast-changing industry.

5. Tech Ecosystems: Building the World's Leading Innovation Clusters

This book investigates the components that make up successful technology ecosystems, including talent, infrastructure, and investment. It compares

different global technology capitals and identifies best practices for fostering innovation. The analysis provides a roadmap for cities and regions aspiring to become tech hubs.

6. *Code and Capital: The Economics Behind the Technology Capital*

Focusing on the financial aspects, this book explores how capital investment drives technological advancement and economic growth in leading tech regions. It examines venture capital trends, startup funding, and the economic impact of technology companies. The book offers a comprehensive view of the intersection between technology and finance.

7. *Global Innovation Hotspots: Mapping the Technology Capitals*

This book provides a global perspective on various technology capitals beyond Silicon Valley, including emerging hubs in Asia, Europe, and Africa. It analyzes factors contributing to their rise and compares their strengths and challenges. Readers gain a broader understanding of the global technology landscape.

8. *The Future of Technology Capitals: Trends Shaping Tomorrow's Innovation Leaders*

Looking ahead, this book discusses emerging technologies and societal shifts that will influence the next generation of technology capitals. It covers topics such as artificial intelligence, green tech, and digital infrastructure. The book offers predictions and strategic insights for policymakers and entrepreneurs.

9. *Women and Diversity in the Technology Capital*

This important work highlights the role of diversity and inclusion in driving innovation within technology capitals. It shares stories of women and underrepresented groups making significant contributions to the tech industry. The book advocates for inclusive practices as essential to sustaining creativity and growth.

technology capital of the world: Capital and Humanity: Research Study on the World's Billionaire's (English Book) Aleem Tahir , 2025-10-04 Capital and Humanity: Research Study on the World's Billionaire's (English Book) is very important Book of our History.Aleem Tahir.

technology capital of the world: Technology and Capital in the Age of Lean Production Tony Smith, 2000-08-10 The first defense of Marxian political economy against the common interest claims of lean production.

technology capital of the world: The Smart City in a Digital World Vincent Mosco, 2019-08-28 This book looks at what makes a city smart by describing, challenging, and offering democratic alternatives to the view that the answer begins and ends with technology. Drawing on worldwide case studies documenting the redevelopment of old and the creation of new cities, it provides an essential guide to the future of urban life in a digital world.

technology capital of the world: China as the World Factory Kevin H. Zhang, 2006-09-27

Few countries have integrated into the world economy as fast – or as dramatically – as China has since 1978. The world's most populous country is emerging as a world workshop and export machine: a visit to a department store in any country will unearth a plethora of goods manufactured in the People's Republic. China is now the world's fourth largest exporting nation. In this important book, Kevin Zhang brings together an international team of contributors to analyze this development process. Taking a thematic approach, the book covers: * manufacturing exports and the world workshop * foreign capital and china's industrial development * challenges from the WTO and openness. This topical analysis will be an excellent resource for postgraduate students and researchers in the fields of Asian and Chinese studies, export studies, and economics.

technology capital of the world: *Managing Information Technology in a Global Economy*

Information Resources Management Association. International Conference, 2001 Today, opportunities and challenges of available technology can be utilized as strategic and tactical resources for your organization. Conversely, failure to be current on the latest trends and issues of IT can lead to ineffective and inefficient management of IT resources. *Managing Information Technology in a Global Economy* is a valuable collection of papers that presents IT management perspectives from professionals around the world. The papers introduce new ideas, refine old ones and possess interesting scenarios to help the reader develop company-sensitive management strategies.

technology capital of the world: *Innovation and Information Technology* United States.

Congress. House. Committee on Science, 2006

technology capital of the world: Zhongguancun Model: Driving the Dual Engines of Science & Technology and Capital Xiaoying Dong, Yanni Hu, Weidong Yin, Estela Kuo, 2018-11-03

This book presents for the first time a detailed and comprehensive interpretation of Zhongguancun, China's first national self-dependent innovation demonstration zone. Explored in the book are examples of world-class, leading enterprises in fields, such as the Internet, big data, artificial intelligence, green and low-carbon, modern supply chain and high-end service. According to some data, the rate of contribution to the economic increase of Beijing made by Zhongguancun rose to 36.8% in 2015 from 17.9% in 2010. More specifically, in 2015, nearly 40% of the economic increase in Beijing was contributed by Zhongguancun Science Park. By 2017, Zhongguancun fostered 650 gazelle enterprises and 70 unicorn companies. The book also uniquely provides readers with a panoramic interpretation of the environment for innovation and entrepreneurship in Zhongguancun. It is mainly divided into three parts: History of Zhongguancun, Data of Zhongguancun, Cases of Zhongguancun and Policies of Zhongguancun. Through the depiction of history, data, cases and policy, this book clarifies that in most cases, enterprises in Zhongguancun become successes by following such a road characterized by starting from scratch and by relying on science and technology innovation and expanding from small to big by virtue of the capital market. “Zhongguancun Model: Driving the Dual Engines of Science & Technology and Capital” deepens the reader's understanding of the new economy development in China and is essential reading for business/management researchers and practitioners, economists, IT specialists, and IT policy makers around the world.

technology capital of the world: *World Capital Markets* Wendy Dobson, Gary Clyde

Hufbauer, Hyun Koo Cho, 2001 This study analyzes the supply side of the international financial architecture. It asks the question: How can G-10 capital suppliers reform their system to contribute to a safer world of capital mobility? It contains coverage of capital flows and the benefits of cross-border capital flows.

technology capital of the world: *Startup Capitals* Zafar Anjum, 2014-12-15

As the Internet has matured in technology and reach, we have seen an explosion in tech startups all over the world. Not only are some of these startups changing the world and how we live in it, they are also proving to be the engines of job creation—an aspect that will be critical in the future. To support these startups, new ecosystems are popping up all over the globe to help grow these companies, aided by governments, successful entrepreneurs, and venture capitalists. In *Startup Capitals*, Zafar Anjum

brings you a ringside view from the world's top ten startup cities of the world. Well-researched and highly insightful, this book lays bare the engines of innovation and the lessons that can be learnt from these burgeoning startup capitals.

technology capital of the world: *Avoiding Surprise in an Era of Global Technology Advances* National Research Council, Division on Engineering and Physical Sciences, Committee on Defense Intelligence Agency Technology Forecasts and Reviews, 2005-07-01 The global spread of science and technology expertise and the growing commercial access to advanced technologies with possible military application are creating potentially serious threats to the technological superiority underpinning U.S. military strength. Key to dealing with this situation is the ability of the U.S. intelligence community to be able to provide adequate and effective warning of evolving, critical technologies. To assist in performing this task, the Technology Warning Division of the Defense Intelligence Agency (DIA) asked the National Research Council (NRC) to undertake a study examining technology warning issues. This report provides the first part of that study. It presents an assessment of critical, evolving technologies; postulates ways potential adversaries could disrupt these technologies; and provides indicators for the intelligence community to determine if such methods are under development. The intention of this report is to establish the foundation for a long-term relationship with the technology warning community to support the examination of technology warning issues.

technology capital of the world: Digital Technologies for Agricultural and Rural Development in the Global South Richard Duncombe, 2018-04-05 This book shares research and practice on current trends in digital technology for agricultural and rural development in the Global South. Growth of research in this field has been slower than the pace of change for practitioners, particularly in bringing socio-technical views of information technology and agricultural development perspectives together. The contents are therefore structured around three main themes: sharing information and knowledge for agricultural development, information and knowledge intermediaries, and facilitating change in agricultural systems and settings. With contributions reaching beyond just a technological perspective, the book also provides a consideration of social and cultural factors and new forms of organization and institutional change in agricultural and rural settings. An invaluable read for researchers in international development, socio-economics and agriculture, it forms a useful resource for practitioners working in the area.

technology capital of the world: *Acquisition of Technological Capability in Small Firms in Developing Countries* H. Romijn, 1998-11-18 An authoritative examination of how small firms in developing countries acquire technological capability - the knowledge and skills required to operate technology effectively and to adapt it to local conditions. It fills a gap in the established literature on technological capability, which has neglected the small-scale sector in spite of the important role it plays in employment generation. The author develops a methodology for a quantitative assessment of the learning process, using case material from the small-scale capital goods sector in Pakistan's Punjab Province.

technology capital of the world: Long-Term International Capital Movements and Technology Mr.Harm Zebregs, 1999-09-01 This paper reviews the theoretical literature on the question of how long-term international capital movements depend on the international distribution of technology. It focuses on long-term investment flows, as these are more affected by international differences in technologies than short-term financial flows. International capital movements are investigated in the context of various technology specifications, ranging from models with only one common technology to those with multiple and endogenous technologies. The paper demonstrates that the theoretical specification of technology is crucial to the prediction of the size and direction of international capital movements.

technology capital of the world: *Theory of Bipolar World* HUANG FENGLIN, 2020-07-15 This academic work, inheriting and developing the basic principles of Marxism, analyzes the world's historical structure by using materialist dialectics and forecasts the direction of the socialist movement and the ways to realize communism. It not only makes up for the horizontal dynamic part

of Marxist theory but also points out a logical path for the development of human society. Furthermore, it predicts the proposal and practice of China's the Belt and Road Initiative from various aspects and provides the theoretical basis and rationale for building a community with a shared future for mankind. The theory about the contradictory movement between productive forces and production relations is the crucial part of Marxism and used to guide socialist revolution and construction as well as analyze world history. Nevertheless, classic writers failed to unveil their relations due to the historical limitations of materialist dialectics and lack of horizontal perspective to investigate the development of nature and human society. As a result, either productive forces or production relations are regarded as the only deciding factor in Marxist theory and practice, and the argument remains. This book, based on a large number of empirical analyses, solved the fundamental problem of historical materialism from the perspective of geographical competition. This book holds that after the invention of agriculture in the Neolithic Age, species competition was replaced by land-based geographic competition, which has become the fundamental driving force for the development of human society. It not only brought about private ownership and social organizations such as patriarchal clans, tribes, nationalities, classes, countries and regions, but also made the two poles of the East and the West compete in changing social forms, develop productive forces and shape world history after the formation of the Inner Asian nomads. This book divides the history of the bipolar competitions between the East and the West after 500 B.C. into three stages. The beginning of the first stage was marked by powerful feudalist China as the power core, ending with the rise of capitalist United Kingdom, which was the power core of the second stage. During this stage, with the acquisition of land taxes as its driving force, four relatively independent political-economic entities were formed from the East to the West with decreasing civilization degree: ancient China, Inner Asia, Islam and Europe (referred to as Zone 4, Zone 3, Zone 2 and Zone 1 respectively in this book). The second stage, with the capitalist UK as the power core, ended with the development of socialist China, which was the core of power at the third stage. The driving force at this stage was the attainment of raw material market. Based on the first-generation bipolar world pattern, two relatively independent political-economic entities, the capitalist system and the socialist system, have been formed from the West to the East. This stage was divided into three phases of economic colonization, focusing on the realms of public goods, natural monopoly and competition. This book uses a large amount of historical data to analyze the specific levels of the two stages. Despite the fact that factual data support is not sufficient sometimes and some conclusions are open to discussion, the theoretical system is complete in line with macro events and the overall framework is convincing. By analyzing the first and second stages, this book makes a theoretical prediction about the phases and outcomes of the third stage. This book holds that the third stage began with the development of socialist China and will end with the realization of world communism and the extinction of geo-competitive relations. The driving force of this stage is the acquisition of property rights cooperation. Based on the second-stage bipolar world pattern, it will undergo three phases of state-owned enterprises cooperation in the realm of competition, natural monopoly and public goods. The world, from east to west, will form an entity with no social difference. The author believes that under the background of the advantageous West and disadvantageous East in the economic globalization, a structural union based on geo-economy is the only option. Cross-border cooperation of state-owned enterprises is the only way to break the natural restriction of private economy, win the principal status in the world competition, solve the problem of sufficient demand at home and abroad, enhance the economic and political situation of the working class in various countries, and get rid of the dependence on the capitalist colonial system. The property right cooperation of state-owned enterprises, therefore, is the fundamental driving force for the future development of human society. This book sums up this historical process of economic cooperation as one driving force (the transnational property rights cooperation of state-owned enterprises), three phases (first Zones 4 and 3, then Zones 4, 3 and 2, and finally Zones 4, 3, 2 and 1) and three realms (first competition, then natural monopoly and finally public goods). The book was finalized in early 2013, and the Chinese version was published by the Central Compilation & Translation Press in

March 2014. In September and October 2013, Chinese President Xi Jinping proposed to the world the initiative to jointly build the Silk Road Economic Belt and the 21st Century Maritime Silk Road. The Belt and Road Initiative, tracing its history back to the ancient Silk Road, aims to jointly build a community of shared interests, future and responsibilities through economic cooperation, featuring political mutual trust, economic integration and cultural tolerance. Since it is launched, the initiative has received extensive attention and recognition from the international community. It has achieved great success in solving China's own economic problems, providing sufficient supply to countries along the route, enhancing endogenous momentum in undeveloped countries, improving people's living standard and promoting the preservation and appreciation of surplus assets worldwide. We can see that when carrying out the Belt and Road Initiative, the property rights cooperation between state-owned enterprises of China and other countries along the line has played a crucial role. Countries in Zone 3, such as Russia, Inner Asia and Pakistan, have taken the lead in making significant progress in cooperation with China in Zone 4. Breakthroughs are achieved in competitive fields such as infrastructure, energy, manufacturing and trade. All these have proved the book's scientific predictions about the third stage. This book not only develops Marxist theory but also proves the scientific prophecy by the practice of the Belt and Road Initiative. Since the Chinese version was issued, it has received wide attention and recognition from all sides. When preparing the foreign language version, the author has dramatically compressed and modified the Chinese version of the content, making the book more complete and more readable.

technology capital of the world: International Trade And Agriculture: Theory And Policy

Jimmy S. Hillman, 2019-03-08 International agricultural trade now exceeds one trillion dollars. It is one of the key factors in the world economy, and the United States, like many other countries, depends on it to keep food prices reasonable, our balance of payments healthy, and the dollar from collapsing on the international money exchanges. The Symposium on International Trade and Agriculture held at Tucson, Arizona, in April 1977, covered all major topics of trade and commerce policy as they relate to agriculture. The papers presented in this book reflect the major concerns of outstanding professional economists and a great variety of agricultural research organizations.

technology capital of the world: Energy: A Global Outlook Abdulhady Hassan Taher,

2013-10-22 Energy a Global Outlook: The Case for Effective International Co-Operation discusses the historical, current, and future issues related to the international oil industry and the global energy situation. The book is organized into three parts. Part I provides an economic and political evaluation, including topics such as the historical evolution of the international oil industry; global energy supply and demand balance; and impact of structural changes on the international energy industries. Part II analyses both historical and regional energy scenario, and Part III presents the statistical data. Readers concerned with the status of the global energy resource will find this book a great source of information regarding the matter.

technology capital of the world: Global Inequalities in World-Systems Perspective

Manuela Boatca, Andrea Komlosy, Hans-Heinrich Nolte, 2017-09-22 During its 500-year history, the modern world-system has seen several shifts in hegemony. Yet, since the decline of the U.S. in the 1970s, no single core power has attained a hegemonic position in an increasingly polarized world. As income inequalities have become more pronounced in core countries, especially in the U.S. and the U.K., global inequalities emerged as a new topic of social scientific scholarship, ignoring the constant move toward polarization that has been characteristic of the entire modern world-system. At the same time, the rise of new states (most notably, the BRICS) and the relative economic growth of particular regions (especially East Asia) have prompted speculations about the next hegemon that largely disregard both the longue durée of hegemonic shifts and the constraints that regional differentiations place on the concentration of capital and geopolitical power in one location. Authors in this book place the issue of rising inequalities at the center of their analyses. They explore the concept and reality of semiperipheries in the 21st century world-system, the role of the state and of transnational migration in current patterns of global stratification, types of catching-up development and new spatial configurations of inequality in Europe's Eastern periphery as well as the prospects

for the Global Left in the new systemic order. The book links novel theoretical debates on the rise of global inequalities to methodologically innovative approaches to the urgent task of addressing them.

technology capital of the world: Technology Transfer in Fibres, Textiles and Apparel
