## **Setting and Historical Context**

The story of "Lessons in Chemistry" is set primarily in the 1960s, a period of significant social change but also entrenched gender roles, especially in professional environments. This historical backdrop is crucial for understanding the challenges faced by the protagonist and the social commentary embedded in the narrative.

## **1960s America and Gender Roles**

During the 1960s, American society was characterized by rigid gender expectations, with women often relegated to domestic roles or supportive positions in the workforce. The scientific community was particularly male-dominated, and women like Elizabeth Zott had to confront widespread discrimination. This setting amplifies the struggles and triumphs of the main character.

## **Scientific Environment**

The era's scientific environment was one of rapid advancement but limited inclusivity. Some conform to societal expectations, while others, like Elizabeth, push against the constraints imposed on them. These characters help to paint a broader picture of women's experiences during the 1960s.

## **Antagonists and Institutional Barriers**

Several characters embody the obstacles Elizabeth faces, including male colleagues who underestimate her or actively hinder her progress. These antagonistic figures are essential for illustrating the systemic sexism prevalent in the scientific field and society at large during the story's setting.

characteristics of the present time are, the numerous applications which are every day made of the knowledge of the laws of nature, which modern science has so successfully investigated. During thirty years of peace the highest intellects of Europe have been dedicated to the advancement of the useful arts; and the discovery of new and refined instruments of research, by giving accuracy to the investigations of the philosopher, have not only enabled him to advance with confidence beyond the footmarks of his predecessors, but even to enter upon and subjugate regions hitherto considered as destined to remain inaccessible to human inquiry. Among the sciences, Chemistry in particular has, within the last few years, advanced with a celerity which even the most sanguine could not have anticipated; and it must be to us a matter of congratulation, that it is our fortune to live in an age in which the advantages of its brilliant discoveries are experienced by every individual. If we should estimate the value of any science by its effects upon the commerce and prosperity of nations, - by its influence upon the useful arts, and its contributions to the enjoyments of our race, - we must give the first place to Chemistry.
